

ABSTRACT OF THE DISCLOSURES

A component for ground covers for trees and bushes consisting of a substantially non-transparent plate which at each rim has a rim strip which is a substantially non-transparent strip protruding from each rim of the substantially non-transparent plate which has many penetrable holes which allow pins to penetrate through and pin down the component on the ground; the substantially non-transparent plate having one or more weakened zone(s) which span(s) inclusively from one rim strip to the other rim strip; a portion of the substantially non-transparent plate being severable along the weakened zone; along an edge of each weakened zone the substantially non-transparent plate having a weakened zone strip which is a substantially non-transparent strip protruding from the surface of the substantially non-transparent plate; the weakened zone having at least a groove or the weakened zone being a curve depicted by a series of holes on the component; the substantially non-transparent plate having optionally a slightly concave top surface; the substantially non-transparent plate optionally having many small holes for air and water to penetrate through.
